The Regional Information Report Series was established in 1987 and was redefined in 2006 to meet the Division of Commercial Fisheries regional need for publishing and archiving information such as project operational plans, area management plans, budgetary information, staff comments and opinions to Board of Fisheries proposals, interim or preliminary data and grant agency reports, special meeting or minor workshop results and other regional information not generally reported elsewhere. Reports in this series may contain raw data and preliminary results. Reports in this series receive varying degrees of regional, biometric and editorial review; information in this series may be subsequently finalized and published in a different department reporting series or in the formal literature. Please contact the author or the Division of Commercial Fisheries if in doubt of the level of review or preliminary nature of the data reported. Regional Information Reports are available through the Alaska State Library and on the Internet at <http://www.adfg.alaska.gov/sf/publications/>.

## ABSTRACT

This management plan provides the expected 2015 run outlooks and harvest strategies for Kotzebue Sound salmon fisheries. Chum salmon (*Oncorhynchus keta*) are the dominant salmon species in the Kotzebue District most of which are produced in the Kobuk River and Noatak River drainages. Based on the chum salmon run outlook no closures in subsistence fishing are expected and there will be a surplus for commercial harvest. Because of a limited amount of cargo space on airplanes to move the catch to processing facilities the department will open the commercial fishery based on the buyer capacity. The department will restrict commercial fishing time if commercial catches or test fish catches indicate a weak run or if a more orderly fishery is necessary to prevent waste.

Key words: Kotzebue Sound, Kobuk, Noatak, chum salmon, *Oncorhynchus keta*, subsistence, commercial, fishing, escapement, management strategy.

## INTRODUCTION

This Kotzebue District salmon fisheries management plan is to inform fishermen, processors and other interested people of the management strategies for the commercial salmon fishery. The Kotzebue District includes all waters from Cape Prince of Wales to Point Hope. The Kotzebue District is divided into three subdistricts. Subdistrict 2, near the mouth of the Noatak River is closed to commercial fishing by regulation. Most fishing occurs in Subdistrict 1, which is subdivided into six statistical areas to help managers determine catch location (Figure 1). Within the Kotzebue District chum salmon *Oncorhynchus keta* are the most abundant anadromous fish. Other salmon species (Chinook *O. tshawytscha*, pink, *O. gorbuscha*, coho, *O. kisutch*, and sockeye *O. nerka*) occur in lesser numbers, as do Dolly Varden *Salvelinus malma*, and sheefish (inconnu) *Stenodus leucichthys*.

## HISTORICAL FISHING EFFORT

### Subsistence Fishery

Subsistence fishing has long been an important food gathering activity for people of the Kotzebue Sound drainages. The most recent subsistence survey of salmon harvests in 2012, excluding city of Kotzebue residents, estimated a total of 18,879 chum salmon were harvested from the Kobuk River and 7,814 chum salmon were harvested from the Noatak River. Over 90% of the subsistence salmon harvests are chum salmon. Subsistence salmon surveys were done in 2013 and 2014, but the results are not yet available. Previous surveys in the 2000s indicate that Kotzebue residents harvest approximately the same amount of salmon as all the other villages combined.

### Commercial Fishery

The historical commercial chum salmon harvests are listed in Table 1. Commercial chum salmon harvests during the 20 years when there was a major buyer (1982–2001) ranged from 55,907 to 521,406 fish, the 20-year average being 220,720. The 5-year (1997–2001) average catch was 141,741. This significant decrease reflects the lack of demand for salmon on the open market that began in the mid-1990s as buyers began to purchase less salmon. Fishing effort during 1982–2001 ranged from 45 to 199 fishermen. The 20-year average was 129 fishermen; the 5-year average from 1997–2001 was 61 fishermen. The decrease in participation was likely due to substantial price declines and declining market.

In 2002, the last significant buyer in the commercial fishery decided to not purchase fish in Kotzebue. Because there was no major buyer only 3 permit holders fished in 2002. Likewise, in 2003 there were only 4 permit holders. In both 2002 and 2003, one permit holder became a

licensed agent for a buyer outside of Kotzebue, and worked with other permit holders to provide product for that market.

Beginning in 2004 one buyer provided a limited market for permit holders. From 2004–2008 there were less than 50 permit holders participating in the commercial fishery each year with the average being 44 permit holders. The fishing effort was approximately one-third the fishing effort of 20 years prior to this time period. In 2009 there was an increase to 62 permit holders participating in the fishery and in 2010, 67 permit holders fished. In 2011, because of runway closures at the Kotzebue airport due to construction, the buyer switched to evening and overnight fishing periods. Although the price of \$0.40 per pound for chum salmon was the same as the previous year there was a much larger fishing effort in 2011 when 89 permit holders fished. The increase in fishing effort was likely the result of the evening fishing hours allowing those with day jobs to participate in the fishery. The buyer decided to continue with evening fishing periods in 2012 because of the increased fishing effort compared to previous years. There was a slight drop in fishing effort with 83 permit holders participating in the 2012 commercial fishery and this may have been attributable to the chum salmon price of \$0.32 per pound that was a 20% decrease from the price paid in 2011. The 2012 catch of 227,965 chum salmon was below the two previous years, but was the fourth highest commercial catch in 20 years. In 2013, a second buyer purchased salmon late in the season, but a further decrease of nearly 20% of the chum salmon price per pound to \$0.27 likely contributed to only 66 permit holders fishing.

One of the best chum salmon runs in history in 2014 combined with three major buyers resulted in the price peaking early in the season at \$0.78 per pound and an average price of \$0.56 per pound. The harvest of 636,187 chum salmon was the second greatest on record and the 94 permit holders fishing was the highest in 20 years (Table 1).

## **2015 RUN OUTLOOK**

The outlook for the 2015 season is based on the parent-year escapements and returning age classes observed in the commercial fishery and in the test fish samples from the Kobuk River in 2014. The 4-year-old component of the run is expected to be average based on the 3-year-old return in 2013. The 5-year-old component of the run is expected to be well above average based on the 4-year-old return last year. The 3-year-old and 6-year-old age classes are much smaller components of the run and are expected to be average. The commercial harvest is expected to fall within the range of 300,000 to 500,000 chum salmon, if market conditions can accept that level of harvest and several major buyers return in 2015.

## **MANAGEMENT STRATEGIES**

No subsistence fishing restrictions are expected in 2015. Primary commercial fishery management objectives are to provide adequate chum salmon passage through the commercial fishery: (1) to ensure sustained runs by allowing adequate escapement, and (2) to meet subsistence harvest uses. Fishery management will be dependent on comparing period and cumulative season catch rates to prior years and test fishing results on the Kobuk River, and the Noatak River if test fishing occurs there.

Age composition of commercial salmon catches will be monitored to determine the strength of age classes in the run. If there is a low abundance of older salmon, which tend to migrate into freshwater first, catch rates will likely be weak early in the season. A strong 4-year-old return may cause midseason catches to rise.

Demand for chum salmon is unknown at this time, but two out of three buyers from last year have confirmed that they plan to return for 2015 season. However, there is expected to be a drop in fishing prices from last year because of market conditions.

If the commercial fishery is similar to last year there will be 6 to 12 hour fishing periods on any day of the week, except Saturday in the first two weeks of July and likely shorter fishing periods as the peak of the run comes in. If buyers opt for longer fishing periods similar to the 12-hour periods in the late 1990s and early 2000s then there will likely be a one-day closure midweek unless the run is strong enough to allow fishing periods 6 days per week.

The department intends to open the commercial fishery anytime after July 9 when the buyers are ready or permit holders indicate they are ready to fish and a market is available. By regulation the commercial season closes after August 31.

If poor run strength necessitates fishing restrictions, the department will establish periodic closures of the fishery. The department will confer with buyers if concern arises about salmon runs and the need to reduce commercial fishing time.

If commercial catches indicate a weak run, and are in agreement with test fish catches in the Kobuk River, the department will consider reducing fishing time in late July to two short duration periods per week or less. If commercial catches indicate sufficient run strength the department will allow commercial fishing to continue based on market conditions and escapement indicators. Likewise, in August as the Noatak River chum salmon run passes through the district the department will consider restrictions if commercial catches indicate a weak run.

## **ESCAPEMENT OBJECTIVES**

Inseason escapement-based management will consist of one test fish project on the Kobuk River, possible limited test fishing on the Noatak River, and reports from subsistence fishermen. The test fishing project on the Kobuk River, in the vicinity of Kiana, will provide an inseason index of chum salmon passage. The department has an index objective of 600 for the season at the test fish project. If the index is projected to fall short of 600, then a restriction in commercial fishing time will be necessary to make sure adequate escapement is moving into the Kobuk River. Test fishing may occur in August on the Noatak River and comparisons made to previous season's catches. If there are poor test fish catches on the Noatak River or there are poor catches in the commercial fishery, then a restriction in commercial fishing time may be necessary.

Aerial surveys may be attempted beginning in September. Aerial surveys are not a direct count or estimate of the salmon population, but are used as an index for comparison with surveys both in season and in prior years. Surveys are conducted too late to affect present year fisheries decisions, but do provide useful information in evaluating management decisions and help project future salmon returns. Aerial survey data are utilized to: (1) evaluate initial run strength while salmon are traveling to the spawning grounds, and (2) document peak salmon abundance on the spawning grounds as an index to total escapement. These enumeration techniques are best initiated during times of low river water levels, high water clarity, and good sunlight penetration. Unfortunately, these conditions are not always available.

One of the primary fishery management strategies is to provide for escapement within sustainable escapement goal ranges (SEG) for each river system. These ranges developed in 2007 are based on an analysis of historical harvest and escapement information of specific index areas within major drainages. These aerial survey escapement objectives are: (1) subject to

continued review, (2) intended to evaluate escapement trends between years, and (3) are not a total count of the salmon escapement. The Noatak and upper Kobuk Rivers are flown annually if personnel and weather conditions permit and other rivers are flown on an opportunistic basis. The chum salmon escapement goals are as follows: Noatak River (mouth to Kelly Bar, including the Eli River) — 42,000 to 91,000, Squirrel River — 4,900 to 10,500, Salmon River — 3,300 to 7,200, Tutuksuk River — 1,400 to 3,000, and upper Kobuk River — 9,700 to 21,000.

2013	319,062	66	4,834	\$689,165
Average	201,442	109	2,042	\$593,833

<sup>a</sup> During 1962–1966 and 1968–1971 figures represent the number of vessels licensed to fish in the Kotzebue District, not the number of fishermen.

<sup>b</sup> Some estimates between 1962 and 1981 include only chum value which in figures represent over 99% of the total value. Figures after 1981 represent the chum value as well as incidental species such as Dolly Varden, whitefish and other salmon.

<sup>c</sup> Includes 2,000 chum salmon and \$3,648 from the Sikusuilaq Springs hatchery terminal fishery.

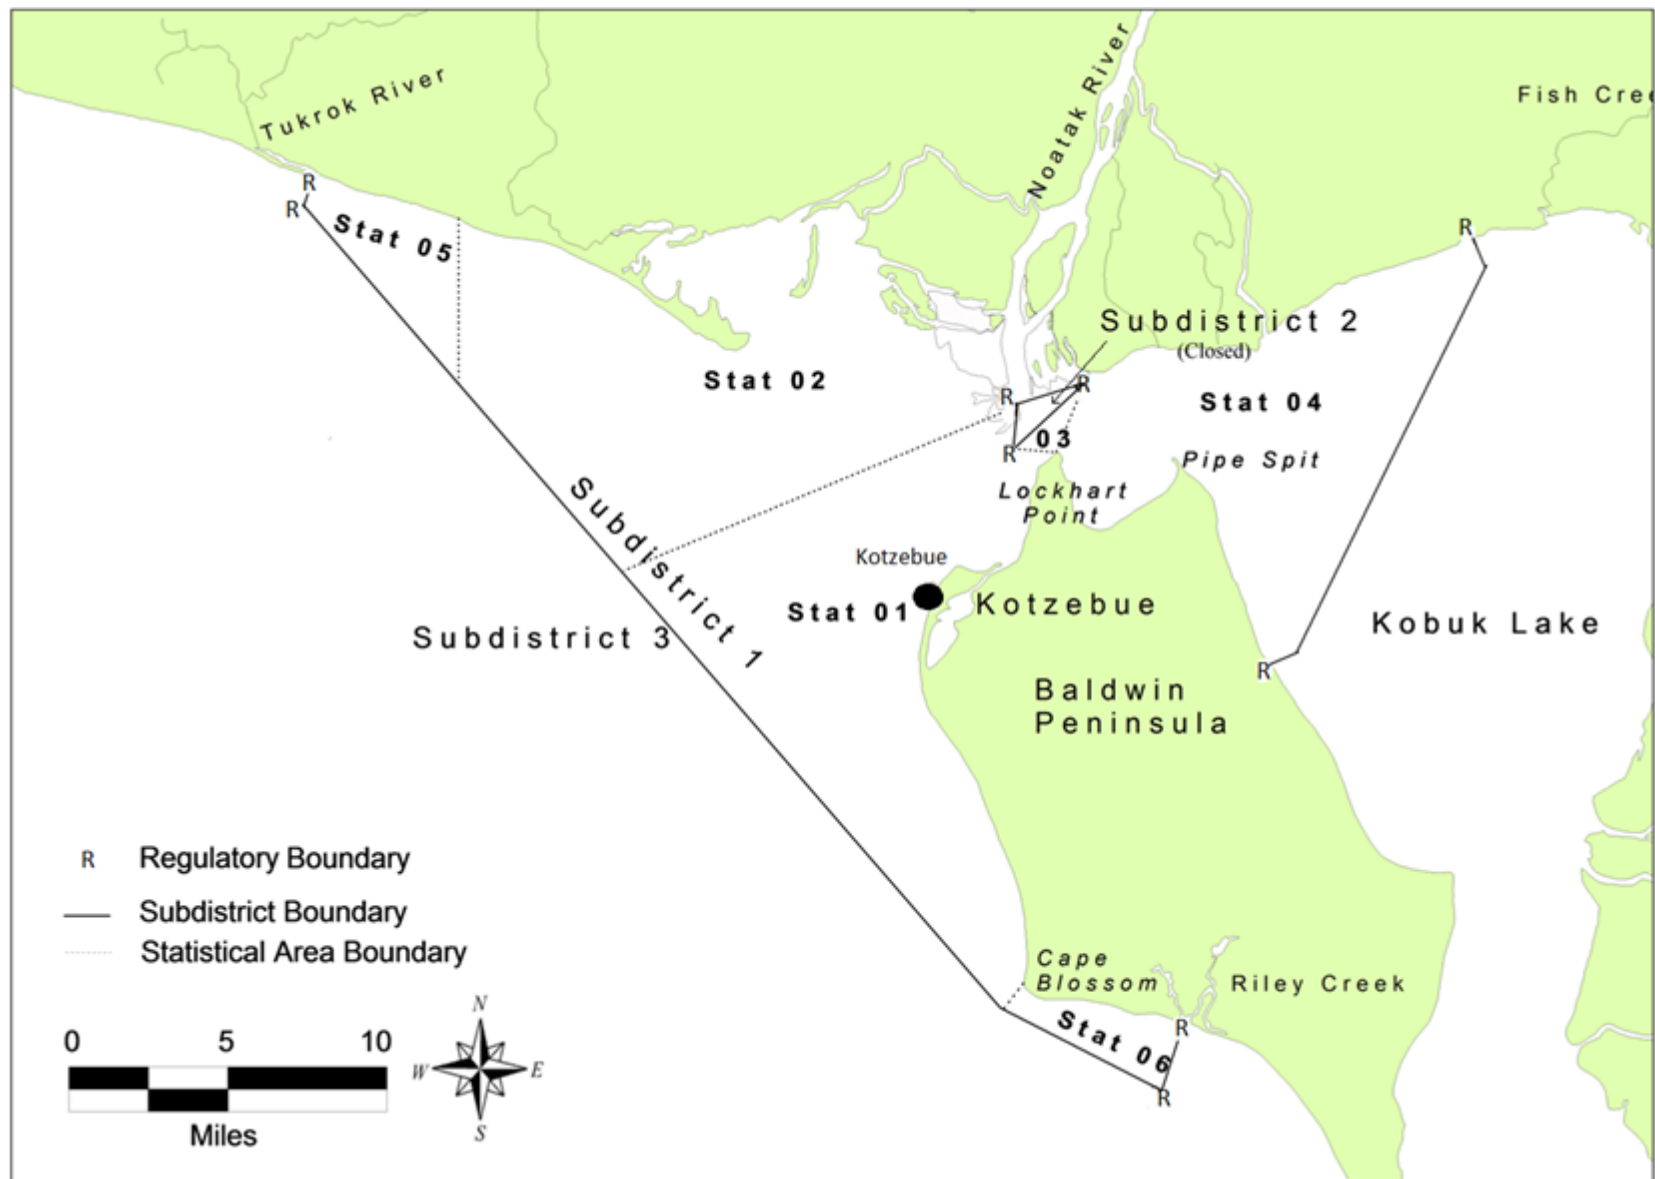

Figure 1.—Kotzebue Sound salmon subdistricts.
